

Mansakha Complete Updates & Bug Fixes

feature: Victim Dashboard Text Visibility **what was the bug:** Certain text elements on the victim dashboard were too light and blended into the background, making them unreadable. **current update:** Changed the CSS text colors to be darker (black/dark gray) for proper contrast and visibility.

feature: Victim Sidebar Navigation **what was the bug:** The "My Counselor" link was buried or poorly positioned in the sidebar. **current update:** Moved the "My Counselor" tab above the "Profile" tab in the sidebar for easier access.

feature: Victim Profile Cleanup **what was the bug:** The user profile page contained redundant "call counselor" options that cluttered the interface. **current update:** Removed the redundant "talk to counselor" tile from the profile page.

feature: Victim Dashboard Chat Tile **what was the bug:** The main dashboard lacked a direct, clear way for victims to contact their assigned counsellor via chat. **current update:** Added a dedicated "Chat with Counsellor" tile on the dashboard that redirects the victim directly to the WhatsApp of their assigned counsellor.

feature: Victim Dashboard Button Performance **what was the bug:** The buttons on the dashboard were taking too much time to visually switch or respond when clicked. **current update:** Optimized the button transition speeds and interaction states to be snappy and responsive.

feature: Chatbot Sidebar UI **what was the bug:** The chatbot interface and sidebar were misaligned or overflowing, making it difficult to use alongside the main dashboard content. **current update:** Fixed the sidebar layout and alignment so the chatbot sits perfectly in the UI without overflowing.

feature: Chatbot Message Sending (Enter Key) **what was the bug:** Pressing the 'Enter' key did not send the message; users were forced to manually click the send button. **current update:** Enabled 'Enter' key functionality so hitting enter instantly submits the message to the chatbot.

feature: Chatbot Voice Integration **what was the bug:** The voice recording icon was either missing, disabled, or overlapping with the text input field. **current update:** Enabled and properly aligned the voice icon within the chat input area for seamless audio recording.

feature: Victim Distress Assessment (Submit Button) **what was the bug:** On the final question (question 15) of the assessment, the button still said "Next" instead of "Submit". **current update:** Changed the button logic so that at question 15, the "Next" button switches to "Submit".

feature: Victim Distress Score Generation **what was the bug:** Submitting the assessment did not properly trigger the AI to analyze the results. **current update:** Wired the final submit button to send the responses to the Ollama backend so it can generate the distress score accurately.

feature: Staff Login Page UI Redesign **what was the bug:** The staff login page used a clunky dropdown to select between Counsellor, Admin, and Data Operator, and it lacked clear admin level separation. **current update:** Redesigned the login page to use a sleek segmented control button row for the main roles. When "Admins" is selected, a new dynamic dropdown appears to select the specific Admin Level (National, State, or District).

feature: Staff First-Time Login Flow **what was the bug:** New staff members could not securely change their temporary passwords upon first login. **current update:** Integrated a mandatory "Change Password" flow directly into the login screen for users logging in with a temporary password for the first time.

feature: Counsellor Case Management ("My Victims") **what was the bug:** Counsellors were seeing a general case queue but didn't have a dedicated space to view only the victims specifically assigned to them. **current update:** Built a brand new "My Victims" feature and API endpoint exclusively for counsellors to manage their assigned cases.

feature: Direct Victim Communication (Counsellor Side) **what was the bug:** Counsellors had to manually copy-paste victim phone numbers to contact them outside the platform. **current update:** Integrated deep links in the Case Detail page that instantly redirect the counsellor to their default Phone Dialer or WhatsApp when clicking the victim's number.

feature: District Admin Victim Registration **what was the bug:** District Admins had access to the "Register Victim" page, which violated the role-based access rules. **current update:** Removed the "Register Victim" feature and routing completely for the District Admin tier.

feature: Dashboard Terminology **what was the bug:** The UI inconsistently used the word "Graph" or "Graphs" which didn't sound professional for a government analytics dashboard. **current update:** Replaced all instances of the word "Graph" with "Analysis" across the entire platform.

feature: Admin Analytics Reports Redesign **what was the bug:** The Reports page was just a basic, plain table filled with hardcoded demo values, which was not professional or attractive for admins. **current update:** Completely redesigned the Reports page to be highly attractive with gradient stat cards, SVG donut charts, and stacked matrices.

feature: Live Data Wiring for Reports **what was the bug:** The redesigned reports page was still showing demo values instead of actual system data. **current update:** Wired the Reports page up to the `useAdminDashboard` hooks so it displays real, live caseload statistics.

feature: National Admin Alerts Parity **what was the bug:** The National Admin lacked the "Alerts" feature that state and district admins had. **current update:** Granted the National Admin full access to the Alerts system, populated with aggregated national alert data.

feature: National Admin Dashboard Features **what was the bug:** The National Admin dashboard was missing the state-wise breakdown drill-downs and features available on the State dashboard. **current update:** Expanded the National Dashboard to match the feature depth of the State dashboard, but scaled up for national data.

feature: Dashboard Case Count Aggregation **what was the bug:** The Admin Dashboards were displaying - or 0 for "Total Cases", "High-Risk", and "Critical"

despite cases existing in the table. **current update:** Fixed the backend count logic which was returning incorrect variable names (total vs totalCases).

feature: Dashboard Case Stage Column **what was the bug:** The "Case Stage" column in the District Admin case list was displaying as - for every victim.

current update: Updated the backend SQL query to successfully fetch and return the case_stage property to the frontend table.

feature: Report Generation & Export **what was the bug:** Clicking the "Generate Report" button on the dashboards only created a silent internal database log instead of giving the user a file. **current update:** Modified the "Generate Report" button on all dashboards to instantly download a formatted CSV spreadsheet of the data directly to the user's computer.
